Science and Engineering Practices

Constructing Explanations and Designing Solutions
Constructing explanations and designing solutions in 6–8 builds on K–5 experiences and progresses to include constructing explanations and designing solutions supported by multiple sources of evidence consistent with scientific knowledge, principles, and theories.
- Apply scientific ideas or principles to design an object, tool, process or system.

Planning and Carrying Out Investigations
Planning & carrying out investigations to answer questions or test solutions to problems in 6–8 builds on K–5 experiences & progresses to include investigations that use multiple variables & provide evidence to support explanations or design solutions.
- Plan an investigation individually & collaboratively, & in the design: identify independent & dependent variables & controls, what tools are needed to do the gathering, how measurements will be recorded, & how many data are needed to support claim.
- Conduct an investigation & evaluate the experimental design to produce data to serve as the basis for evidence that can meet the goals of the investigation.

Asking Questions and Defining Problems
Asking questions and defining problems in grades 6–8 builds from grades K–5 experiences and progresses to specifying relationships between variables, and clarifying arguments and models.
- Ask questions that can be investigated within the scope of the classroom, outdoor environment, and museums and other public facilities with available resources and, when appropriate, frame a hypothesis based on observations and scientific principles.

Engaging in Argument from Evidence
Engaging in argument from evidence in 6–8 builds from K–5 experiences and progresses to constructing a convincing argument that supports or refutes claims for either explanations or solutions about the natural and designed world.
- Construct and present oral and written arguments supported by empirical evidence and scientific reasoning to support or refute an explanation or a model for a phenomenon or a solution to a problem.

Crosscutting Concepts

Systems and System Models
Models can be used to represent systems and their interactions—such as inputs, processes and outputs—and energy and matter flows within systems.

Stability and Change
Explanations of stability and change in natural or designed systems can be constructed by examining the changes over time and forces at different scales.

Cause and Effect
Cause and effect relationships may be used to predict phenomena in natural or designed systems.

Many thanks to... the teachers and administrators who helped develop and revise the pacing guides.

The Science Pacing Guide is based on the Next Generation Science Standards, and the I CAN statements are tailored to the needs of the students in the Lansing School District. For easy access to the actual state standards as well as supporting information and resources visit the official Next Generation Science Standards website at: www.nextgenscience.org.

Introduction to Your Science Pacing Guide

- Introduce 9-week content skills according to the Pacing Guide.
- Once a skill is mastered, continue to practice it.
- Continue to reinforce skills and concepts throughout the year until mastery is achieved.
- Skills can be introduced earlier than listed, but no later, and can be assessed at any point after introduction.
- Compare your current pace to the Pacing Guide and adjust as needed.
- Become familiar with sequencing at previous and subsequent grade levels.
- The website, www.nextgenscience.org, can be used to find more information and to better understand Michigan State Standards.
- An electronic version of the Pacing Guides can be found on the Lansing School District homepage www.lansingschools.net under Quicklinks.

<td></td>
<td></td>
</tr>
<tr>
<td>▶ For any pair of interacting objects, the force exerted by the first object on the second object is equal in strength to the force that the second object exerts on the first, but in the opposite direction (Newton’s third law).</td>
<td>▶ The motion of an object is determined by the sum of the forces acting on it; if the total force on the object is not zero, its motion will change. The greater the mass of the object, the greater the force needed to achieve the same change in motion. For any given object, a larger force causes a larger change in motion.</td>
<td>▶ Electric and magnetic (electromagnetic) forces can be attractive or repulsive, and their sizes depend on the magnitudes of the charges, currents, or magnetic strengths involved and on the distances between the interacting objects.</td>
</tr>
</tbody>
</table>
Science and Engineering Practices

Planning and Carrying Out Investigations
Planning and carrying out investigations to answer questions or test solutions to problems in 6–8 builds on K–5 experiences and progresses to include investigations that use multiple variables and provide evidence to support explanations or design solutions.

- Plan an investigation individually and collaboratively, and in the design: identify independent and dependent variables and controls, what tools are needed to do the gathering, how measurements will be recorded, and how many data are needed to support a claim.

Engaging in Argument from Evidence
Engaging in argument from evidence in 6–8 builds on K–5 experiences and progresses to constructing a convincing argument that supports or refutes claims for either explanations or solutions about the natural and designed worlds.

- Construct, use, and present oral and written arguments supported by empirical evidence and scientific reasoning to support or refute an explanation or model for a phenomenon.

Using Mathematics and Computational Thinking
Mathematical and computational thinking at the 6–8 level builds on K–5 and progresses to identifying patterns in large data sets and using mathematical concepts to support explanations and arguments.

- Use mathematical representations to describe and support scientific conclusions and design solutions.

Developing and Using Models
Modeling in 6–8 builds on K–5 experiences and progresses to developing, using, and revising models to describe, test, and predict more abstract phenomena and design systems.

- Develop and use a model to describe phenomena.

Obtaining, Evaluating, and Communicating Information
Obtaining, evaluating, and communicating information in 6–8 builds on K–5 and progresses to evaluating the merit and validity of ideas and methods.

- Integrate qualitative scientific and technical information in written text with that contained in media and visual displays to clarify claims and findings.

Crosscutting Concepts

Scale, Proportion, and Quantity
Proportional relationships (e.g. speed as the ratio of distance traveled to time taken) among different types of quantities provide information about the magnitude of properties and processes.

Energy and Matter
Energy may take different forms (e.g. energy in fields, thermal energy, energy of motion).

Patterns
Graphs and charts can be used to identify patterns in data.

Structure and Function
Structures can be designed to serve particular functions by taking into account properties of different materials, and how materials can be shaped and used.

### Grade 8

#### UNIT 3 Energy

<table>
<thead>
<tr>
<th>I CAN Statements</th>
</tr>
</thead>
<tbody>
<tr>
<td>☐ I CAN plan an investigation to determine relationships among the energy transferred, the type of matter, the mass, and the change in the average kinetic energy of the particles as measured by the temperature of the sample.</td>
</tr>
</tbody>
</table>

**Disciplinary Core Ideas**

- Temperature is a measure of the average kinetic energy of particles of matter. The relationship between the temperature and the total energy of a system depends on the types, states, and amounts of matter present.
- The amount of energy transfer needed to change the temperature of a matter sample by a given amount depends on the nature of the matter, the size of the sample, and the environment.

<table>
<thead>
<tr>
<th>Standard MS.PS3.4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plan an investigation to determine the relationships among the energy transferred, the type of matter, the mass, and the change in the average kinetic energy of the particles as measured by the temperature of the sample.</td>
</tr>
<tr>
<td>Clarification Statement: Examples of experiments could include comparing final water temperatures after different masses of ice melted in the same volume of water with the same initial temperature, the temperature change of samples of different materials with the same mass as they cool or heat in the environment, or the same material with different masses when a specific amount of energy is added.</td>
</tr>
</tbody>
</table>

#### UNIT 4 Waves and Electromagnetic Radiation

<table>
<thead>
<tr>
<th>I CAN Statements</th>
</tr>
</thead>
<tbody>
<tr>
<td>☐ I CAN construct an argument and hold a conversation to support a claim that when the kinetic energy of an object changes, energy is transferred to or from the object.</td>
</tr>
<tr>
<td>☐ I CAN use mathematical representations to describe a simple model for waves that includes how the amplitude of a wave is related to the energy in a wave.</td>
</tr>
</tbody>
</table>

**Clarification Statement**: Emphasis is on describing waves with both qualitative and quantitative thinking.

<table>
<thead>
<tr>
<th>Standard MS.PS4.1</th>

### Science and Engineering Practices

**Analyzing and Interpreting Data**
Analyzing data in 6–8 builds on K–5 experiences and progresses to extending quantitative analysis to investigations, distinguishing between correlation and causation, and basic statistical techniques of data and error analysis.

- Analyze and interpret data to determine similarities and differences in findings.
- Analyze displays of data to identify linear and nonlinear relationships.

**Constructing Explanations and Designing Solutions**
Constructing explanations and designing solutions in 6–8 builds on K–5 experiences and progresses to include constructing explanations and designing solutions supported by multiple sources of evidence consistent with scientific ideas, principles, and theories.

- Apply scientific ideas to construct an explanation for real-world phenomena, examples, or events.
- Construct an explanation that includes qualitative or quantitative relationships between variables that describe phenomena.

**Using Mathematics and Computational Thinking**
Mathematical and computational thinking in 6–8 builds on K–5 experiences and progresses to identifying patterns in large data sets and using mathematical concepts to support explanations and arguments.

- Use mathematical representations to support scientific conclusions and design solutions.

- Students can accurately measure with a metric ruler, stopwatch, beaker, thermometer, graduated cylinder, and triple beam balance.
- Students expected to measure with estimates between marked intervals on the measurement tool.
- Students are developing a testable statement based on research, making observations, and connecting to prior knowledge.
- If...then...because format is provided by teacher.

### Patterns

- Patterns can be used to identify cause and effect relationships.
- Graphs, charts, and images can be used to identify patterns in data.

**Cause and Effect**
Phenomena may have more than one cause, and some cause and effect relationships in systems can only be described using probability.

### Introduction to Your Science Pacing Guide

Pacing Guides create a realistic time frame for instruction and assessment. They establish paced, student learning expectations and provide a starting point for the implementation of the Michigan State Standards.

The following tips may be helpful as you begin using the Pacing Guide:

- Introduce 9-week content skills according to the Pacing Guide.
- Once a skill is mastered, continue to practice it.
- Continue to reinforce skills and concepts throughout the year until mastery is achieved.
- Skills can be introduced earlier than listed, but no later, and can be assessed at any point after introduction.
- Compare your current pace to the Pacing Guide and adjust as needed.
- Become familiar with sequencing at previous and subsequent grade levels.
- The website, www.nextgenscience.org, can be used to find more information and to better understand Michigan State Standards.
- An electronic version of the Pacing Guides can be found on the Lansing School District homepage www.lansingschools.net under Quicklinks.

Revised 8.2017
### Disciplinary Core Ideas

- The collection of fossils and their placement in chronological order (e.g., through the location of the sedimentary layers in which they are found or through radioactive dating) is known as the fossil record. It documents the existence, diversity, extinction, and change of many life forms throughout the history of life on Earth.

- The geologic time scale provides a way to organize Earth's history. Analyses of rock strata and the fossil record reveal similarities that show relationships not evident in the fully-formed anatomy.

### I CAN Statements

- **Standard MS.LS4.1, ESS1.4**
  
  **Construct a scientific explanation based on evidence from rock strata for how the geologic time scale is used to organize Earth's 4.6-billion-year-old history.**

  **Clarification Statement:** Emphasis is on how analyses of rock formations and the fossils they contain are used to establish relative ages of major events in Earth's history. Examples of Earth's major events could range from being very recent (such as the last Ice Age or the earliest fossils of homo sapians) to very old (such as the formation of Earth or the earliest evidence of life).

- **Standard MS.LS4.2**
  
  **Apply scientific ideas to construct an explanation for the anatomical similarities and differences among modern organisms and between modern and fossil organisms to infer evolutionary relationships.**

  **Clarification Statement:** Emphasis is on how variations of traits in a population increase the survival and reproduction of some individuals, which changes the distribution of traits in a population over time.

- **Standard MS.LS4.3**
  
  **Analyze displays of pictorial data to compare patterns of similarities in the embryological development across multiple species to identify relationships not evident in the fully formed anatomy.**

  **Clarification Statement:** Emphasis is on how genetic variations of traits in a population increase individuals’ probability of surviving and reproducing in a specific environment.

- **Standard MS.LS4.4**
  
  **Construct an explanation based on evidence that describes how genetic variations of traits in a population increase some individuals' probability of surviving and reproducing in a specific environment.**

  **Clarification Statement:** Emphasis is on using mathematical models, probability statements, and proportional reasoning to support explanations of trends in changes to populations over time.

- **Standard MS.LS4.6**
  
  **Use mathematical representations to support explanations of how natural selection may lead to increases and decreases of specific traits in populations over time.**

  **Clarification Statement:** Emphasis is on using mathematical models, probability statements, and proportional reasoning to support explanations of trends in changes to populations over time.
Science and Engineering Practices

Developing and Using Models
Modeling in 6–8 builds on K–5 experiences and progresses to developing, using, and revising models to describe, test, and predict more abstract phenomena and design systems.
▶ Develop and use a model to describe phenomena.

Analyzing and Interpreting Data
Analyzing data in 6–8 builds on K–5 experiences and progresses to extending quantitative analysis to investigations, distinguishing between correlation and causation, and basic statistical techniques of data and error analysis.
▶ Analyze and interpret data to determine similarities and differences in findings.

Crosscutting Concepts

Patterns
Patterns can be used to identify cause-and-effect relationships.

Systems and System Models
Models can be used to represent systems and their interactions.

Scale, Proportion, and Quantity
Time, space, and energy phenomena can be observed at various scales using models to study systems that are too large or too small.

<td>☐</td>
<td></td>
</tr>
<tr>
<td>☐ I CAN analyze and interpret data to determine scale properties of objects in the solar system.</td>
<td>☐</td>
<td>☐</td>
<td></td>
</tr>
</tbody>
</table>

**Clarification Statement:**
- Examples of models can be physical, graphical, or conceptual.
- Emphasis for the model is on gravity as the force that holds together the solar system and Milky Way galaxy and controls orbital motions within them. Examples of models can be physical (such as the analogy of distance along a football field or computer visualizations of elliptical orbits) or conceptual (such as mathematical proportions relative to the size of familiar objects such as students’ school or state).
- Emphasis is on the analysis of data from Earth-based instruments, space-based telescopes, and spacecraft to determine similarities and differences among solar system objects. Examples of scale properties include the sizes of an object’s layers (such as crust and atmosphere), surface features (such as volcanoes), and orbital radius. Examples of data include statistical information, drawings and photographs, and models.

**Disciplinary Core Ideas**

- Patterns of the apparent motion of the sun, the moon, and stars in the sky can be observed, described, predicted, and explained with models.
- This model of the solar system can explain eclipses of the sun and the moon. Earth’s spin axis is fixed in direction over the short-term but tilted relative to its orbit around the sun. The seasons are a result of that tilt and are caused by the differential intensity of sunlight on different areas of Earth across the year.
- Earth and its solar system are part of the Milky Way galaxy, which is one of many galaxies in the universe.
- The solar system consists of the sun and a collection of objects, including planets, their moons, and asteroids that are held in orbit around the sun by its gravitational pull on them.
- The solar system appears to have formed from a disk of dust and gas, drawn together by gravity.
- The solar system consists of the sun and a collection of objects, including planets, their moons, and asteroids that are held in orbit around the sun by its gravitational pull on them.
